

Sample Designs & New Construction

The procedure of building boats today has changed very little over the centuries. The changes to the basic plank-on-frame method are superficial but significant: advanced tools now allow craftsman to design and deliver far more precision than they used to be able to by hand, and laminated epoxy materials allow for fantastic durability.

Gulet Group International has long been at the forefront of yacht industry in the subjects of new build and new projects. Gulet Group has been building all types of wooden and steel yachts and boats in its contracted modern shipyard that approved by world wide recognized class establishments.

In our shipyard it is possible to build steel or laminated hull gulets up to 45 meters length, our establishment has approved its quality especially on building traditional Turkish type motor sailers. (Gulets).

We are providing you a sample of building steps with a slaytshow on the side to give you some idea how to build a laminated hull, ketch type gulet.

Depending on the gulet size, the construction of a gulet may take from 8 months to 24 months.
